

Executive Report: Membership Conversion

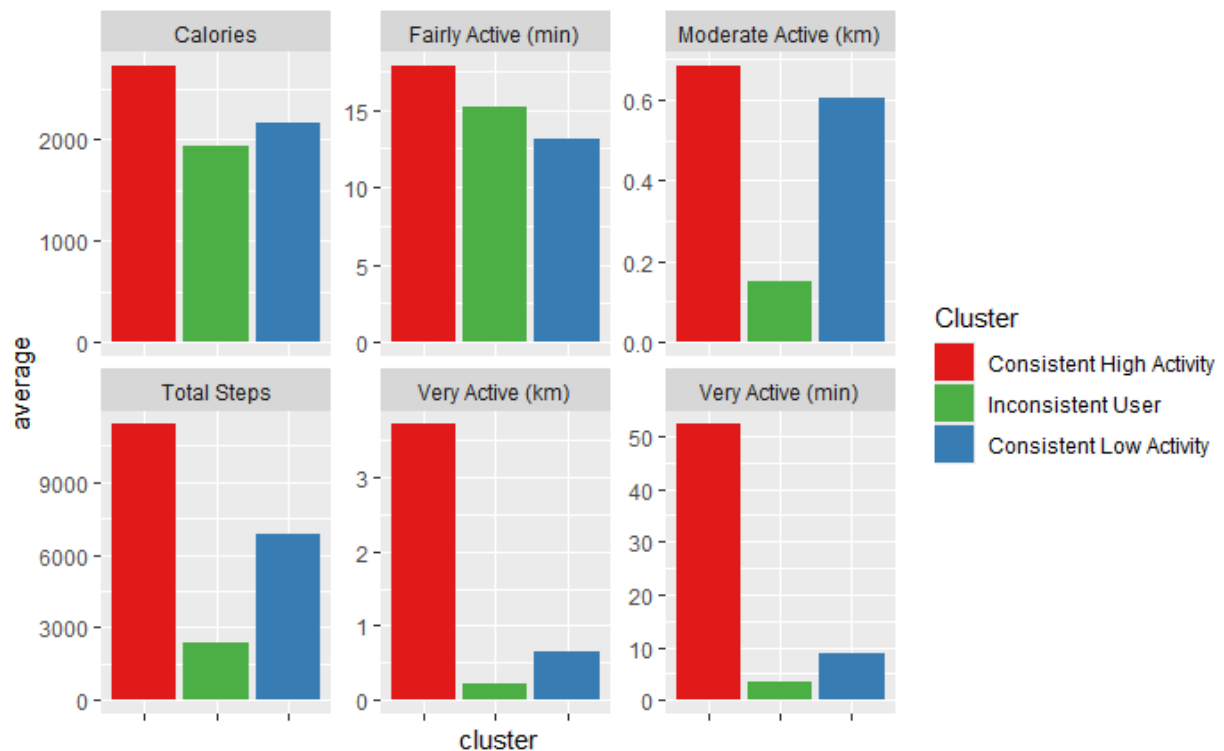

Bellabeat | August 2026 | Case study

Headline Findings

User segmentation

Users are divided into 3 categories: consistent high activity, consistent low activity, and inconsistent users. Each segment shows a distinct behaviour in engagement index and variability of steps. A higher engagement index means the user exercises with more intensity; a higher CV steps means more step variability on a day-to-day basis

Profile of each cluster

The bar plot shows deeper insight into each customer segment's behaviour. The separation between the three segments is obvious. The Consistent High Activity group dominates every intensity metric; the gap is largest in Very Active Km and Very Active minutes.

Recommended Actions

1. Target Consistent user

Consistent users are more likely to show longer engagement: Based on peer-reviewed research, user that has formed a habit are more likely to show longer engagement, whereas an inconsistent user would fall off easily.

Action: A marketing campaign targeted specifically at consistent users would be low risk, high-probability conversion

2. Prioritize Inconsistent Users via habit-formation tools over high-intensity goals.

Their problem is reliability, not volume: streak rewards, gentle reminders on their historically inactive days, and small daily goals move them toward the high-engagement profile.

Action: Ship streak-tracking + inactivity-triggered nudges; set default goals low to rebuild consistency before raising intensity.
